

GITOQLOK

**v2.9.99**

August 8, 2026

Mostly a matter of keeping pace with Qlik: unused master items has been adapted to the newest SaaS and Enterprise interface, and no longer empties out on apps carrying a great many of them. QSDA Pro connections now ask for manual approval when a server's SSL certificate is invalid, and an app can finally be unlinked from a repository that no longer exists.

#### WHAT'S NEW

---

##### **Unused Master Items**

Unused master items has been adapted to the newest Qlik SaaS and Enterprise interface, so it keeps working against current Qlik releases.

##### **Certificate Approval**

A manual approval modal now appears for the QSDA Pro connection when the server's SSL certificate is invalid, so you can decide whether to go ahead with that connection.

##### **Repository Unlink**

An app can now be unlinked from its repository. Deleting a repository used to leave the app still pointing at it, and that link can now be cleared.

#### FIX

---

- Unused master items: the list no longer disappears when an app has a large number of master items.
