

Sheet groups are under version control: commit, update and deploy keep the grouping in Qlik Sense and Qlik Cloud. Ask AI gains a self-hosted provider for any OpenAI-compatible server and reaches the new sheet details dialog, and Application Checklists become Pre-deployment Checklists, with community checklists for Power BI. Fixes cover local changes after an update, deleted public sheets on Qlik Cloud, badge overflow and diff viewer loading.

WHAT'S NEW

Sheet Groups

Sheet groups in Qlik Sense and Qlik Cloud are versioned, as objects/sheetgroups in the repository. Commit, update and deploy keep the grouping, and groups missing from older repositories are created on deploy with default names.

Self-hosted AI

Ask AI has a new Self-hosted provider for any OpenAI-compatible server, such as Ollama, LM Studio, vLLM or LiteLLM, with an optional API key and a free-text model name. Default models are updated to GPT-5.4 mini, Gemini 3.8 Flash and Claude Sonnet 5, and AI settings move to their own Ask AI section of the options page.

Ask AI Placement

Ask AI works in the new Sheet details dialog of Qlik Cloud and the newest Qlik Sense Enterprise, and in the inline sheet rename. Disabled buttons explain on hover that an expression is needed.

Pre-deployment Checklists

Application Checklists are renamed Pre-deployment Checklists. There are community checklists for Power BI, and you can share your own from Power BI reports. Edit, Duplicate and Delete live in the menu, your private checklists are always editable, and several display and saving issues are fixed.

Any Power BI Page

The extension now opens on any Power BI page and tells you to open a report when needed.

FIXES

- Update: Local Changes now compares the app with the pulled commit right after an update, instead of the cached previous commit.
- Qlik Cloud: public sheets and sheet groups deleted in the repository are removed on Update, after being unpublished first.
- UI options: environment badges wrap to a second line inside a tab card instead of overflowing it.
- Diff Viewer: smoother loading.
