

App objects can now be imported from another Soterre application, and sheet diffs across apps have got quieter: a chart id on its own is no longer reported as a change. Feature voting moves into the popup, and a QSDA Pro token fetching issue and a Lifecycle Insights data mismatch are fixed.

WHAT'S NEW

Object Import

App objects can now be imported from another Soterre application, so an object built once can be brought into the app you are working on instead of rebuilt.

Feature Voting

You can vote for features from the popup, so a request goes in from the extension rather than through a separate channel.

Sheet Diff

The diff viewer for sheets across Soterre apps has been improved, and no longer flags a change when the only difference is a chart id. Those matches were noise, so what is left in the diff is the edits that actually matter.

FIX

- Fixed a QSDA Pro token fetching issue and a Lifecycle Insights data mismatch.
