

The Soterre tab takes on more of the deployment workflow — a column for external tickets, an edit version button for Power BI, and deployments launched from a plan with their history alongside. Unused master items has been adapted to the newest Qlik SaaS and Enterprise interface, and QSDA Pro asks before proceeding over an invalid SSL certificate.

WHAT'S NEW

Unused Master Items

Unused master items has been adapted to the newest Qlik SaaS and Enterprise interface, so it keeps working against current Qlik releases.

Certificate Approval

A manual approval modal now appears for the QSDA Pro connection when the server's SSL certificate is invalid, so you can decide whether to go ahead with that connection.

Soterre Tab

The Soterre tab gains a column for external tickets, an edit version button for Power BI, and the ability to launch a deployment from a plan and review its deployment history. Starting a deployment and checking what was deployed before both happen in the tab, without a trip to another tool.
