

Global Search has a tab of its own now, in both the popup and the side panel, on Qlik app pages and Power BI reports alike — change the node, type, field or operator and it re-runs where it stands. The rest is panel craft: a half-height unique users chart, a slimmer pinned results header, a Deploy Now form that gets the panel to itself, and views that start at the same height. Fixes cover tab reordering, a stray scrollbar, the Soterre Helper in the new Qlik Sense Enterprise client and two diff viewer stumbles.

WHAT'S NEW

Lifecycle Insights

The unique users chart is now half as tall. It was pushing the view past the height of the side panel, so the panel no longer needs a vertical scrollbar and Lifecycle Insights reads in one screen.

Deploy Now

Opening the Deploy Now form hides the history table and toolbar behind it, for both Qlik and Power BI. The form gets the full panel instead of sharing it with the history you are not looking at.

Timeline Layout

The Version Now and Restore views now start at the same height as the timeline toolbar, so moving between them no longer shifts the content up or down.

Environment Badges

Each tab card in UI options shows the environments it is available in as small icon badges, so you can see which tabs apply where while arranging your layout.

Global Search

Global Search is now a tab of the popup and the side panel on Qlik app pages and Power BI reports, with an artifact type dropdown. Changing the node, type, field or operator re-runs the search in place, so refining a query does not mean starting it again or leaving the app you are working in.

Power BI Measures

Global Search results on Power BI now list every matching measure of a dataset with the same presentation as Qlik, including highlighted matches and copy buttons. The result list reads the same way on both platforms, and a measure can be copied straight out of it.

Results Header

Only the results count line stays pinned while you scroll a result list, above a slimmer summary, in both Qlik and Power BI. Less of the panel is taken up by the header and more of it by the results.

FIXES

- UI options: drag and drop no longer moves a tab one position too few when dragging forward.
- Search results no longer show a stray horizontal scrollbar.
- Soterre Helper: the diff editor, theme toggle and QVD links are back in the data load editor of the new Qlik Sense Enterprise client.
- Fixed a diff viewer error on freshly versioned apps and a loading hang after opening a standalone script from the Qlik Cloud hub.
