

Pre-deployment Checklists, formerly Application Checklists, go communal: browse shared checklists for Qlik, Power BI and Tableau, or share your own. Ask AI gains a self-hosted provider for any OpenAI-compatible server, and Tableau gets the Timeline, Diff Editor and checklist on workbooks. Everywhere, the extension opens on any Qlik, Power BI or Tableau page and tells you what to open next.

WHAT'S NEW

Community Checklists

Application Checklists are now Pre-deployment Checklists, and there are community checklists for Qlik, Power BI and Tableau to start from. You can share your own with the community too.

Checklist Editing

Edit, Duplicate and Delete live in the checklist menu, and your private checklists are always editable. Several display and saving issues are fixed along the way.

Self-hosted AI

Ask AI has a new Self-hosted provider for any OpenAI-compatible server, such as Ollama, LM Studio, vLLM or LiteLLM, with an optional API key and a free-text model name. Default models are updated to GPT-5.4 mini, Gemini 3.8 Flash and Claude Sonnet 5, and AI settings have their own Ask AI section on the options page.

Ask AI Placement

Ask AI works in the new Sheet details dialog of Qlik Cloud and the newest Qlik Sense Enterprise, and in the inline sheet rename, as a Helper popover above the card. Disabled buttons explain on hover that an expression is needed.

Global Search

The button is back in the Qlik Cloud Create a new application dialog. From the measure editor and the Tools context menu, Global Search opens as a tab of the panel, shows a loading state while it connects to Soterre, and its search fields follow the selected Soterre node.

Integrations Page

The Integrations page of the options shows Soterre, QSDA Pro and Tableau Server as tabs, each with its connection status.

Tableau Workbooks

Timeline, Diff Editor and the Pre-deployment Checklist now work on Tableau workbooks, including switching between workbooks without reloading the page. The Diff Editor for Tableau loads faster, highlights changes right on the charts, fits dashboards to the screen and marks deleted versions.

Collision Detection

The Qlik app collision detection notification is redesigned with a close button and hides itself after ten seconds.

Any Page

The extension now opens on any Qlik, Power BI or Tableau page and tells you to open an application, report or workbook when it needs one.

FIXES

- UI options: environment badges wrap to a second line inside a tab card instead of overflowing it.
- Clearer messages when Soterre is unreachable or the API token is invalid, and the Diff Editor closes instead of hanging.
