

SOTERRE

v3.2.19

July 29, 2026

Deployment from Personal Work can now be disallowed outright on Qlik Sense: the actions are hidden in the UI and the server rejects the request anyway, so the policy holds for calls that never touch the interface. Fixes cover the Deployment Wizard on Qlik and Power BI, and a Tableau re-authentication loop.

WHAT'S NEW

Personal Work Policy

Qlik Sense: a new property disallows deployment from Personal Work. The deployment actions are hidden in the UI and any deployment sourced from Personal Work is rejected by the server, so the policy holds even for requests that do not come through the interface.

FIXES

- Fixed an inefficient SQL query generated when using a direct tag to launch the Deployment Wizard.
- Power BI: fixed a Deployment Wizard bug when adding artifact versions through Sources.
- Tableau: fixed a session timeout issue that could leave the browser stuck in a re-authentication loop.
