

SOTERRE

**v3.2.22**

August 17, 2026

Most of this lands in Power BI review. The diff viewer now handles reports in PBIR format change by change, and report and semantic model comparisons open on a condensed Definition Summary before you commit to the full diff. Large comparisons come back faster, and audit logging has stopped narrating events Soterre never processes.

#### WHAT'S NEW

---

##### **Large Diffs**

Performance has been improved for large diffs, so a comparison over a big artifact returns faster.

##### **PBIR Diff Viewer**

Power BI: the diff viewer now supports comparison of reports in PBIR format. Reports stored in that format can be reviewed change by change rather than only as a whole.

##### **Definition Summary**

Power BI: report and semantic model comparisons now include a Definition Summary tab. It gives reviewers a condensed view of the definition before they work through the detailed diff.

##### **Audit Log Volume**

Power BI: excessive logging has been reduced for audit events Soterre does not process. Logs stay focused on the events that actually drive versioning, which makes them easier to read during an investigation.

#### FIXES

---

- Fixed tagged object deployment selection where a tag is applied to two objects of the same name but different types.
- Tableau: fixed a session issue that could occur when deployment and versioning jobs ran simultaneously.
