

Bridge the Gap Between Cognos and Security Providers

There are many instances when a custom authentication solution is needed to allow IBM Cognos to use non-supported authentication sources:

- Authentication against custom relational database schemas
- Single Sign On (SSO)
- Authentication against custom web services
- Integration with SAML, CAS, ClearTrust, SiteMinder, Tivoli, etc.
- Multi-factor authentication
- Authentication against Peoplesoft

You could try to build a solution yourself but this is an extremely risky endeavor that requires a very specialized skill set.

Avoid Security Risks with MotioCAP

Attempting to build your own CAP (custom authentication provider) can potentially introduce holes in the security system and can compromise the functionality of Cognos. Most of these issues will only be discovered "the hard way."

The MotioCAP framework embeds solutions to these issues so that they are taken care of automatically. MotioCAP provides "flexpoints" for supporting a wide variety of customer specific authentication scenarios in a very secure and performant manner.

Faster Implementation

With MotioCAP, you can reduce the development and implementation time required to create a complete custom authentication provider by as much as 90%, transforming weeks & months into days.

Leverage Motio's Expertise to Ensure Success

We have implemented custom authentication providers for a large number of IBM Cognos customers and in a wide variety of environments since 2004.

The MotioCAP Framework is a robust, proven solution that supports implementations of all sizes and industries across-the-board — from academic institutions and publicly traded financial organizations, to several branches of the U.S. Armed Forces. MotioCAP provides long-term support and is actively updated and tested against the latest Cognos releases.
