

Soterre for Qlik Provides:

- *Zero-touch version control*
- *Zero impact to authors*
- *Capture of changes with insight*
- *Built-In Change Log*
- *Ability to rollback individual changes*
- *Lifecycle for deployment of applications*
- *Help to maintain an Audit ready state*
- *Coordination among collaborators*

Zero-Touch Version Control and Simplified Deployments

Accurate analytics are paramount for your team to make proper business decisions. Qlik enables these decisions by transforming your data into actionable insights. In an agile analytics environment things can get chaotic. Rapid and frequent change requests and adjustments can mean things go wrong and, when they do, being able to revert to the previous last working state is crucial. Without change management and version control, users try to keep things under control by making copies. This takes time, doesn't always get completed when in a rush, leads to differing naming conventions and / or backup locations, and can be error prone as well.

Motio's Soterre monitors Applications in Qlik Sense by versioning them in the background automatically with documentation, thus eliminating the human element. Moving new or existing applications between environments, reverting to a previous version, or undoing a single change is made possible with the push of a button in the user interface. No more copying files or providing server access!

Selectable Objects to deploy:

- Applications
- Sheets
- Streams
- Extensions
- Data Connections
- Analytic Connections
- Tags
- Custom Properties

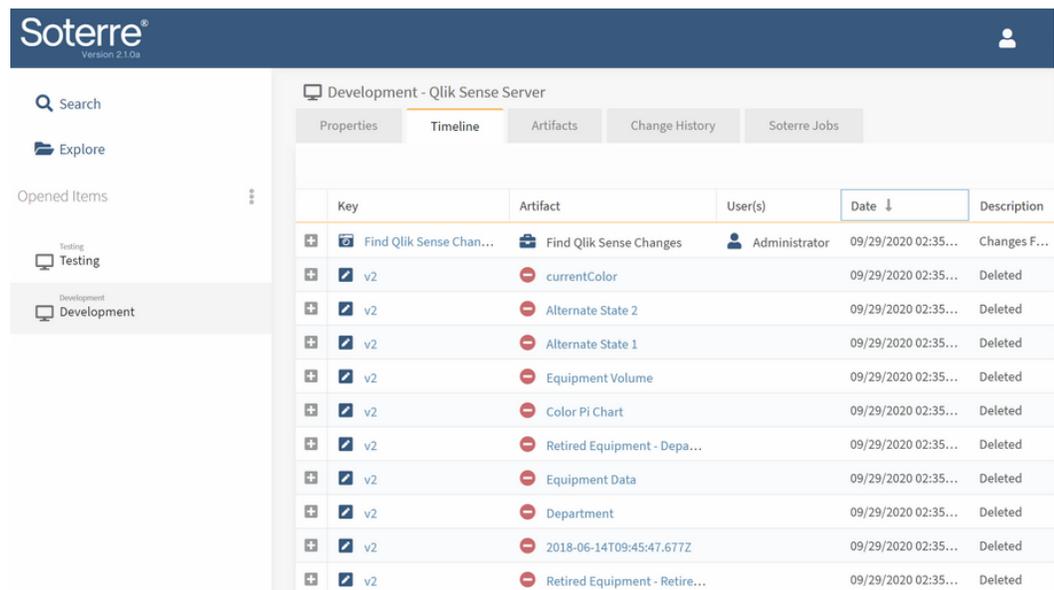

Versioning and Selective Deployments of Objects

Soterre tracks all changes over time so individual changes can be reverted as needed. Soterre can also merge changes from multiple versions via its tagging capability, meaning changes from multiple users or multiple edits can be brought together collaboratively.

Deployments also benefit from tagging. Select individual objects, folders, applications or projects to move content safely from one environment to another and Soterre takes care of the documentation (who, what, where, when and why).

Stay Audit Ready

Tracking of all changes and deployments equips Qlik Sense teams with the documentation and change management tools required to validate with auditors that there are processes and controls in place.
