

Maximize IBM Cognos Analytics Performance

ReportCard Datasheet

ReportCard at a Glance

System Monitoring via Motio ReportCard provides insights into the expected performance of your Cognos environments and alerts you to potential issues before they affect end users. Before implementing a change to your Cognos infrastructure, run ReportCard with your tests to understand how Cognos will perform post-change. ReportCard's system monitoring helps throughout the lifecycle by ensuring you are alerted of issues even before tickets are logged by users.

Explain Cognos Performance Variances

ReportCard's System Monitoring feature continually scans and records your Cognos environment's performance and health. This creates a baseline to which you can compare future outputs to ensure Cognos performance remains as expected.

Based on parameters set by your team, alerts are sent immediately. This gives your team a head start to identify and resolve issues before end users create a ticket.

Know the Performance Impact of an Infrastructure Change

Use ReportCard's baseline to better understand how changes impact performance. Common infrastructure changes include:

- Upgrading Cognos
- Moving to the cloud
- Migrating databases

Comparing the baseline to your environment's status after changes are implemented will identify performance gains or losses and encourage you to move forward with the project.

ReportCard's system monitoring helps throughout the lifecycle by ensuring you are alerted of issues even before tickets are logged by users.

Testing Avoids the Unknown

The load testing functionality shows you how your Cognos environment will perform under load and stress and helps you determine points of performance degradation. ReportCard provides a realistic and easy way to build test scenarios, managing user think time and handling sessions within Cognos.

ReportCard can load and play back the activity from your busiest day and check that Cognos will still work as expected once changes are implemented. Comparing your performance will help you better understand and resolve any issues.

Make data driven decisions by understanding Cognos performance using ReportCard.
